REST

REST Maturity Levels

These notes are combined from

- 1) V. Paliath
- 2) Rajendran, Doran, Balasubramanian Student presentation

Despite Fielding's Theory and the buzz it created, there were no reference models & coalescing of best practices for a while.

• Then about a half-dozen or so years later (2007-10) REST burst into the mainstream, and folks tried to better understand how to put it in practice

Richardson talked at QCon '08 about a Maturity Model for REST:

The evolution of API's/apps claiming to be REST:

Level 0: The Swamp of POX (Plain Old XML)

Level 1: Resources

Level 2: HTTP Verbs

Level 3: Hypermedia Controls (true RESTfulness)

https://www.crummy.com/writing/speaking/2008-QCon/act3.html https://martinfowler.com/articles/richardsonMaturityModel.html

Level 0: The Swamp of POX

- Endpoints are simply URIs that return XML (or JSON) like our OMDB example.
- Requires published specification of all URIs.
- Media-type is usually not semantically appropriate.
- Representation does not contain links to other resources.
- Does not use HTTP verbs appropriately.
- Older API's (i.e., early 2000's looked like this)

```
POST /libraryService HTTP/1.1 {"action":"borrow","isbn": "0068512886","from": "2014-10-02","to":"2014-10-05"}

HTTP/1.1 200 OK {"status":"borrowed","isbn": "0068512886","from": "2014-10-02","to":"2014-10-05"}
```

Level 1: Resources

- Many URIs, one HTTP method
- Has URI representations for resources; like /person/{id}, etc.
- Still has a published specification for different resource URIs.
- Media-types are still not semantically appropriate.
- Still doesn't use HTTP verbs appropriately.
- Some API's that exist today look like this

What is different in the exchange below?

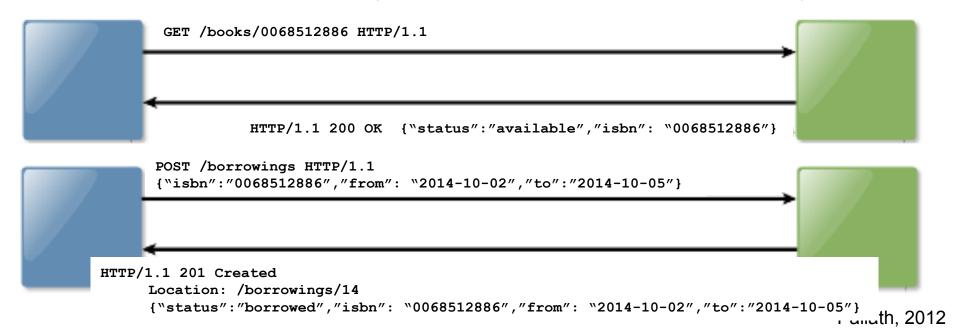

```
POST /books/0068512886 HTTP/1.1
{"action":"borrow","from": "2014-10-02","to":"2014-10-05"}

HTTP/1.1 200 OK
{"status":"borrowed","isbn": "0068512886","from": "2014-10-02","to":"2014-10-05"}
```

Level 2: HTTP Verbs

- Many URIs & endpoints. HTTP response codes semantically appropriate
- Uses appropriate HTTP verbs for operations: GET to <u>retrieve</u> information,
 PUT to <u>replace</u>, POST to <u>create</u>, PATCH to <u>modify</u>, DELETE to <u>delete</u>
- Still doesn't use semantically-appropriate media-types; returns XML/JSON
- Still has published specification.
- API's and applications are moving in this direction.

Check out the different response code to the POST in the exchange below

Level 3: Hypermedia Controls

- We attained true RESTfulness.
- Returns semantically-appropriate media-types.
- Published specs for media-types and complex modeled-relationships.
- Does not need any published URIs other than one endpoint. That is, resources are discoverable.
- Truly adheres to HATEOAS. That is, uses hypermedia to transmit semantically-appropriate information including context of the information and what actions can be performed on this information.

Level 3 Exchange

```
GET /books HTTP/1.1
             Accept: application/vnd.library.collection.json+hal
            HTTP/1.1 200 OK
            {"items":[{"isbn":" 0068512886",
                       " links": {"self": {"href":/books/0068512886
                       "type": "application/vnd.library.collection.json+hal"}}},...]}
             GET /books/0068512886 HTTP/1.1
            Accept: application/vnd.library.collection.json+hal
HTTP/1.1 200 OK
{"items":[{"isbn":"0068512886","title":"Cryptocon","author":"Stephenson","status":"available"
              " links": {"self": {"href":"/books/0068512886"
                                    "type": "application/vnd.library.collection.json+hal"},
                          "borrow": { "href": "/borrowings",
                                      "type": "application/vnd.library.collection.json+hal",
                                      "contentType": "application/vnd.borrow-request.json"}}}
            POST /borrowings HTTP/1.1
            Accept: application/vnd.library.collection.json+hal
            Content-Type: application/vnd.borrow-request.json
            {"isbn":"0068512886","from": "2014-10-02","to":"2014-10-05"}
 HTTP/1.1 201 Created
        Location: /borrowings/14
        {"id":"1","isbn": "0068512886","from": "2014-10-02","to":"2014-10-05",
         " links": {"self": {"href":"/borrowings/14"
                                            "type": "application/vnd.library.borrowing.json+hal"},
                                "book": {"href":"/book/0068512886",
                                              "type": "application/vnd.library.book.json+hal"}}
                                                                                                  Paliath, 2012
```

Richardson's Maturity Model Summary

- Purists still cite Richardson's Maturity Model as justification for what is "REST" and what is not
- As with other maturity models, it does not portend to suggest what is "right" for an organization, or provide a "better or worse" judgment
 - Like all software design decisions, what is "just good enough" usually wins (is most cost-effective).
 - Another way of stating this is, if you can be stable and serve all anticipated clients at a lower maturity level, is it really worth it to be more "RESTfully pure"?
- The model does remain an effective guide however for organizing the API design principles for REST.
